

# We've worked hard for you...

## Product Functionality

Smartlist criteria: Multi-level parent-child

*Added feature to enable conditions on parent-child hierarchy. Up to 4 levels are supported. Conditions can be placed on any level.*

Create New Item: Formatting of numeric fields

*From now on the numeric field formatting as you defined it on the field properties is applied on Create New Item (CNI).*

Overlay on item list on state transition

*You can now show an overlay before a state transition on: the itembox, the bulk update pane and child items tab.*

Customize Page: Position child items as custom field

*It is now possible to place the list of children as a custom field anywhere on the overview or on custom tabs.*

Audits: Dynamic custom field types depending on list type question

*The same field on an Audit Question can now morph into different types of responses based on the question. E.g. free text, flag, selection, ...*

## IMPROVED

State Transitions: flexible transitions

*It is now possible to define a wild card state transition to be defined as source or target status.*

Location GPS Data : accuracy and Z-coordinate

*The location info is enhanced with two new extra fields: accuracy and the z-coordinate signifying the height of the position.*

Export/Import : all items including child and related items

*The selected lists for child items are now included in the export and import.*

Scripting : Remove irrelevant feedback messages

*As a scriptwriter you can remove old feedback messages so that only relevant info is visible. Confusion be gone!*

Scripting : Debugging containing impersonate

*Scripts where an other user is impersonated can now be debugged. Yeehaa!*

Scripting : Trigger extra events on DeleteItem

*Extra events have been added so you, as a scriptwriter, can attach them for your nifty logic. ;-)*

Item Alert Template : Enhance with attachments

*The attachments of an item can now be included in its alert template.*

Bulk Update : Take templated lists into consideration

*Enhanced bulk update in a templated list for fields Status and Priority. Instead of applying changes for each instance list, you now have to apply them once.*

Item Details : History tab : width of columns

*Now the 'From' and 'To' columns occupy available space, which makes them wider and easier to read.*

Script Execution : Update changed items in childitem / itemrelation

*Now updated siblings are reflected immediately, including related items and child items. Everywhere, anytime.*

Indicator : Calculation frequency in minutes

*The frequency an indicator runs on can now be configured down to minutes in addition to hours.*

Scripting : Enable platform-independent navigation

*As a scriptwriter you no longer need to worry on which platform (web or mobile) you redirect the user. One command to rule them all!*

## Product Quality

IMPROVED

API : bulk item update speed-up

*We improved the speed when bulk-updating items as a scriptwriter. You now have more control over the operation.*

REDIS Cache : transactional mechanism

*We made the cache transactional so that it is perfectly synced with the database cache.*

# And many more improvements...

More goodies on the way in the upcoming milestone.
